CLIMATE SQL LAB / 2024

HOW WE MEASURE EMISSIONS CHANGES THE STORY.

TOTAL EMISSIONS

62.3%

of measured CO2 emissions came from Asia.

Adding up emissions shows where the largest amount of CO2 is released.

Largest total by continent

EMISSIONS PER PERSON

9.53

tonnes of CO2 per person in Oceania.

Dividing by population shows emissions per resident. Asia's rate was 4.84 tonnes per person.

Highest rate by continent

THE TAKEAWAY

Use both measures to understand climate impact.

How SQL revealed this: JOIN linked countries to continents; GROUP BY organized the continents; SUM added emissions and population to calculate totals and per-person rates.

Source: climate.db / Our World in Data. CO2 covers fossil fuels and industry. Includes countries with reported CO2 and positive population in 2024. Per-person rates are population-weighted continent averages.
